THE HEY'DI WATERPROOFING SYSTEM, UNIQUE AND HIGHLY EFFECTIVE!

HEY'DI delivers concrete performance... Waterproofing by Crystallization

The HEY'DI waterproofing concept is based on the crystallization process. Unique and highly effective, HEY'DI waterproofing systems chemically react with the moisture and elements naturally found within the pores and capillaries of concrete or masonry substrates. This chemical reaction initiates the formation of crystalline structures and blocks the passage of water, resulting in a waterproof substrate.

Typical applications include foundations, basements, elevator pits, tunnels, dams, water reservoirs, manholes, sewage / water treatment plants and any other underground structure.

HEY'DI waterproofing systems are available in two formulations:

HEY'DI K-11

- Waterproofs from the positive or negative side
- Brush or spray applied to interior or exterior below grade surfaces
- Tested at water heads of 461.6 feet
- Breathable
- Available in Gray and White
- NSF and USDA approved

HEY'DI POWDER X SYSTEM

- Applied to the negative side to stop ACTIVE water leaks caused by hydrostatic pressure
